Two “Special” Bases: 2 and 10

Base 10: Elamites in Iran use early form of base 10 system around 3500 B.C.

Base 2: References to base 2 appeared in the *I Ching*. (2800 B.C.)

Computers are “simple”.
Base 2 is the simplest reasonable base.
Therefore, computers use base 2!

A Brief History of Bases

Negative Numbers

(with the nifty “two’s complement” method)

- Assume that we have only 8 bits to represent numbers
- If we try to increment 11111111 by 1, what happens?
- 00000011 represents 3_{10} . What property should the representation of -3_{10} have so that arithmetic with positive and negative numbers works nicely?

Exercise...

In two's complement (with 3 bits to keep things simpler)...

- What's the negative of 0?
- How is -1 represented?
- What's the largest positive number that can be represented?
- What's the smallest negative number that can be represented?
- Does addition work as expected?
- Is a double negative a positive?

Negative thinking!
